Section 5.3 Tonto Creek Basin

5.3.1 Geography of the Tonto Creek Basin

The Tonto Creek Basin, located in the east central part of the planning area is 955 square miles in area. Geographic features and principal communities are shown on Figure 5.3-1. The basin is characterized by mid-elevation mountain ranges. Vegetation types include Sonoran desertscrub, semidesert grassland, chaparral, woodland and montane conifer forests. Riparian vegetation is found along streams including mixed broadleaf, tamarisk and mesquite along Tonto Creek.

- Principal geographic features shown on Figure 5.3-1 are:
 - o Basin communities of Punkin Center, Rye, Star Valley and Kohls Ranch
 - o Tonto Creek running north to south through the center of the basin from Kohls Ranch and exiting the basin about eight miles south of Punkin Center
 - o The lowest point in the basin is about 5,000 feet along Tonto Creek where it exits the basin
 - o Rye Creek flowing through Rye in the western portion of the basin
 - Spring Creek and Hayler Creek flowing from the eastern basin boundary to Tonto Creek
 - o The Tonto Basin located in the south central part of the basin along Tonto Creek
- Not well shown on Figure 5.3-1 are
 - o The Mogollon Rim along the northern basin boundary
 - o The Sierra Ancha Mountains along the eastern boundary
 - The Mazatzal Mountains along the western boundary, which contain the highest point in the basin, Mazatzal Peak at 7,888 feet

5.3.2 Land Ownership in the Tonto Creek Basin

Land ownership, including the percentage of ownership by category, for the Tonto Creek Basin is shown in Figure 5.3-2. The principal feature of land ownership in this basin is the large amount of forest service land. A description of land ownership data sources and methods is found in Volume 1, Section 1.3.8. Land ownership categories are discussed below in the order of percentage from largest to smallest in the basin.

National Forest and Wilderness

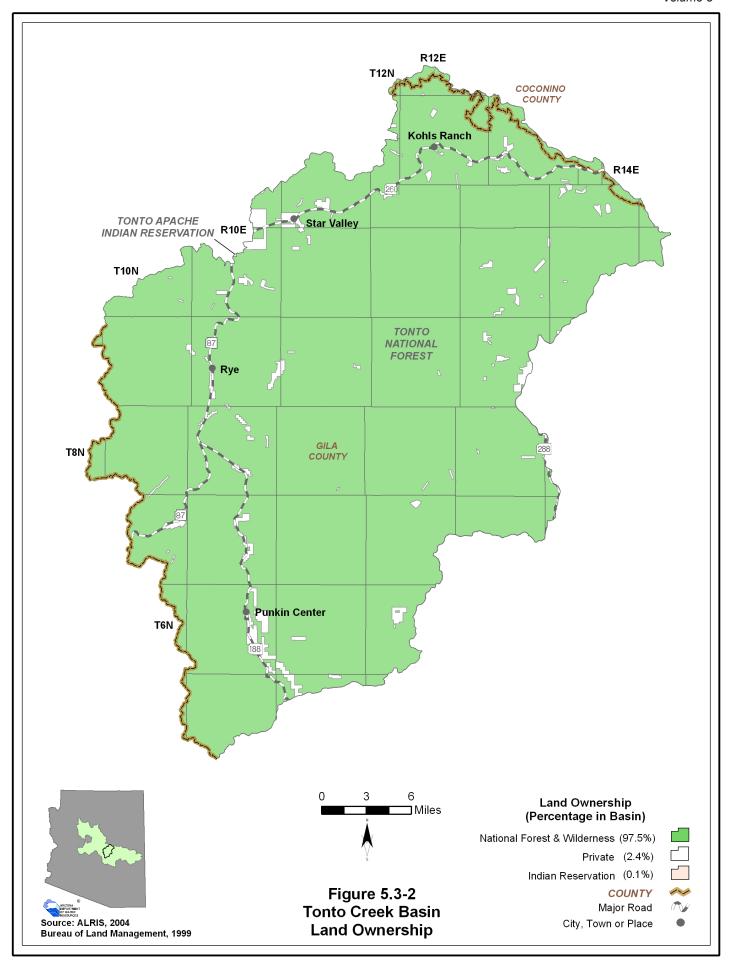

- 97.5% of the land is federally owned and managed as National Forest and Wilderness, the largest percentage of any basin in the planning area.
- Forest lands in the basin are part of the Tonto National Forest.
- The basin contains two wilderness areas, a portion of the 250,053-acre Mazatzal Wilderness and the entire 37,399-acre Hellsgate Wilderness.
- There are numerous small private in-holdings.
- Land uses include recreation, grazing and timber production.

Private

- 2.4% of the land is private.
- Small in-holdings of private land are scattered throughout the basin with a number of larger parcels in the vicinity of Punkin Center and Star Valley.
- Land uses include domestic, commercial and ranching.

Indian Reservation

- 0.1% of the land is under ownership of the Tonto Apache tribe.
- The small portion of tribal land in this basin is located in T10N, R10E.
- Land use includes domestic and ranching.

5.3.3 Climate of the Tonto Creek Basin

Climate data from NOAA/NWS Co-op Network and SNOTEL/Snowcourse stations are complied in Table 5.3-1 and the locations are shown on Figure 5.3-3. Figure 5.3-3 also shows precipitation contour data from the Spatial Climate Analysis Service (SCAS) at Oregon State University. The Tonto Creek Basin does not contain Evaporation Pan or AZMET stations. A description of the climate data sources and methods is found in Volume 1, Section 1.3.3.

NOAA/NWS Co-op Network

- Refer to Table 5.3-1A
- Elevation at the three NOAA/NWS Co-op network stations is similar, ranging from 2,360 feet at Punkin Center to 2,900 feet at Gisela.
- Minimum average temperature ranges from 40.8°F at Gisela to 45.3°F at Punkin Center.
- Maximum average temperatures are also similar and range from 86.8°F at Reno R.S. to 81.9°F at Gisela.
- Station precipitation ranges from 18.23 inches at Punkin Center to 19.77 at Reno R.S.
- The Reno R.S. station reports highest average seasonal rainfall in the fall (October-December) and the other two stations report highest seasonal annual rainfall in the winter (January March). All three stations report the lowest seasonal rainfall in the spring (April-June).

SNOTEL/Snowcourse

- Refer to table 5.3-1D
- There are two stations in this basin, Promontory Butte and Promontory Pillow (SNOTEL). The Promontory Butte station was discontinued in 1989.
- Both stations are at an elevation of 7,930 feet and record highest average snowpack in April.
- The highest average snowpack at Promontory Butte is 15.1 inches and at Promontory Pillow (SNOTEL) is 14.1 inches. Snowpack is measured in inches of snow water content. Ten inches of fresh snow can contain as little as 0.10 inches of water or up to 4 inches depending on a number of factors. The majority of U.S. snows fall with a water-to-snow ratio of between 0.04 and 0.10. (NSIDC, 2006)

SCAS Precipitation Data

- See Figure 5.3-3
- Additional precipitation data shows rainfall as high as 38 inches on the northern basin boundary at the Mogollon Rim and as low as 14 inches on the southern basin boundary south of Punkin Center.
- In general, precipitation increases as altitude increases in this basin. The range of 24 inches between areas of highest and lowest precipitation is common for the planning area.

Table 5.3-1 Climate Data for the Tonto Creek Basin

A. NOAA/NWS Co-op Network:

| Otation No. | Elevation (in | Period of Record | Average Temper | ature Range (in F) | Av | erage Tota | l Precipitati | ion (in incl | nes) |

5.3.4 Surface Water Conditions in the Tonto Creek Basin

Streamflow data, including average seasonal flow, average annual flow and other information is shown in Table 5.3-2. Flood ALERT equipment in the basin is shown in Table 5.3-3. Reservoir and stockpond data, including maximum storage or maximum surface area, are shown in Table 5.3-4. The location of streamflow gages identified by USGS number, flood ALERT equipment and USGS runoff contours are shown on Figure 5.3-4. A description of stream data sources and methods is found in Volume 1, Section 1.3.16. A description of reservoir data sources and methods is found in Volume 1, Section 1.3.11. A description of stockpond data sources and methods is found in Volume 1, Section 1.3.15.

Streamflow Data

- Refer to Table 5.3-2.
- Data from four stations located on Tonto Creek and Rye Creek are shown in the table and on Figure 5.3-4. Three of the four stations have been discontinued. The fourth station, Tonto Creek above Gun Creek near Roosevelt, is a real-time station.
- The average seasonal flow at all stations is highest in the winter (January-March) when between 43% and 65% of the average annual flow occurs. The average seasonal flow is lowest at all stations in the summer (July-September) when between 7% and 10% of the average annual flow occurs.
- Maximum annual flows range from 469,256 acre-feet (1978, Tonto Creek above Gun Creek near Roosevelt) to 64,289 acre-feet (1978, Rye Creek near Gisela). Minimum annual flows range from 1,245 acre-feet (1971, Rye Creek near Gisela) to 32,796 acre-feet (1974, Tonto Creek near Gisela).
- Both gaged streams in this basin have a mean annual flow of over 10,000 acre-feet. Tonto Creek has a recorded mean annual flow of over 100,000 acre-feet.

Flood ALERT Equipment

- Refer to Table 5.3-3.
- As of October 2005, there were nine stations in the basin. All stations are in Gila County, however, one station is operated by the Maricopa County Flood Control District. The remaining stations are operated by the Gila County Flood Control District.
- Of the nine stations, six are precipitation only stations, two are precipitation/stage stations and one is a repeater/precipitation station.

Reservoirs and Stockponds

- Refer to Table 5.3-4.
- The basin does not contain any large reservoirs.
- Surface water is stored or could be stored in one small reservoir in the basin. This reservoir has a maximum storage of 20 acre-feet.
- There are 389 registered stockponds in this basin.

Runoff Contour

- Refer to Figure 5.3-4.
- Average annual runoff is two inches per year in the southern tip of the basin and increases to five inches per year in the northern portion of the basin.

Table 5.3-2 Streamflow Data for the Tonto Creek Basin

A. Large Reservoirs (500 acre-feet capacity and greater)

| MAP KEY | RESERVOIR/LAKE NAME (Name of dam, if different) | OWNER/OPERATOR | MAXIMUM STORAGE (AF) | USE | JURISDICTION |
|---------|---|----------------------------|-------------------------|-----|--------------|
| | | None identified by ADWR at | t this time | | |

B. Other Large Reservoirs (50 acre surface area or greater)

| MAP KEY | RESERVOIR/LAKE NAME (Name of dam, if different) | OWNER/OPERATOR | MAXIMUM SURFACE AREA (acres) | USE | JURISDICTION |
|---------|--|----------------------------|------------------------------------|-----|--------------|
| | | None identified by ADWR at | this time | | |

C. Small Reservoirs (greater than 15 acre-feet and less than 500 acre-feet capacity)

Total number: 1

Total maximum storage: 20 acre-feet

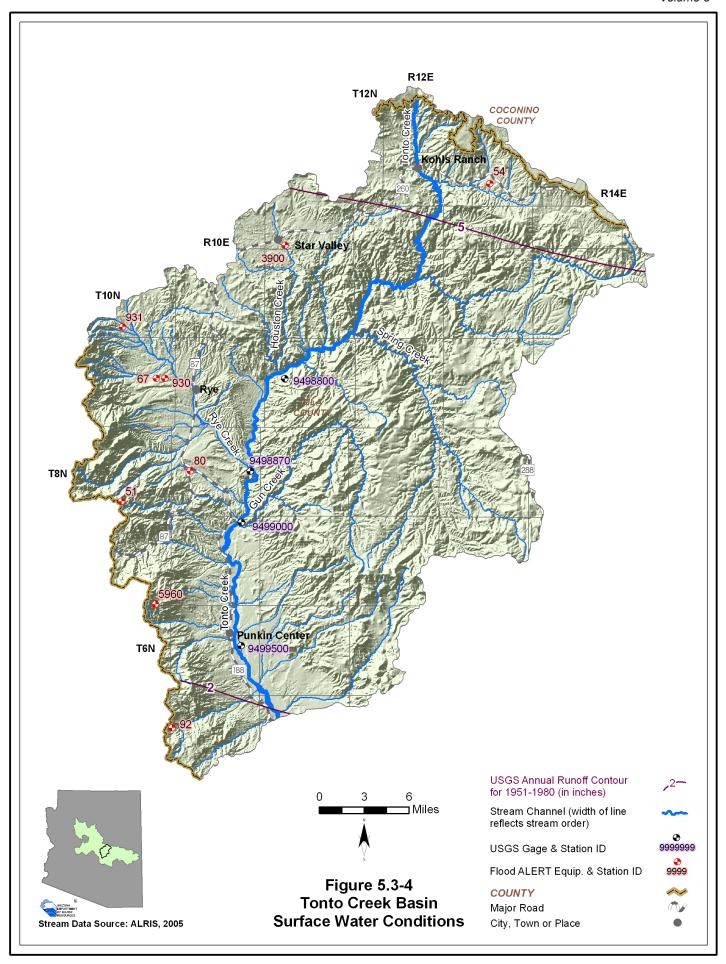

D. Other Small Reservoirs (between 5 and 50 acres surface area)

Total number: 0

Total surface area: 0 acres

E. Stockponds (up to 15 acre-feet capacity)

Total number: 389 (from water right filings)

5.3.5 Perennial/Intermittent Streams and Major Springs in the Tonto Creek Basin

Major and minor springs with discharge rates and date of measurement, and the total number of springs in the basin are shown in Table 5.3-5. The locations of major springs and perennial and intermittent streams are shown on Figure 5.3-5. A description of data sources and methods for intermittent and perennial reaches is found in Volume 1, 1.3.16. A description of spring data sources and methods is found in Volume 1, Section 1.3.14.

- Perennial streams in this basin include Tonto Creek, Haigler Creek, Spring Creek, Dell Shay Creek, Houston Creek, Christopher Creek and Greenback Creek.
- There are numerous intermittent streams located throughout the basin.
- Tonto Creek is the longest continuously perennial stream in the basin. Most other perennial streams also contain intermittent reaches.
- There are 10 major springs with a measured discharge of 10 gallons per minute (gpm) or greater at any time.
- Listed discharge rates may not be indicative of current conditions. Only four of the ten springs have measured discharges in the past decade.
- All springs are found in the vicinity of Kohls Ranch in the northern portion of the basin below the Mogollon Rim. The greatest discharge rate was measured near the Gila and Coconino County boundary (Tonto, 1,291 gpm).
- Three of the major springs have measured discharge rates of 100 gpm or greater.
- Springs with measured discharge of 1 to 10 gpm are not mapped but coordinates are given in Table 5.3-5B. There are seven minor springs identified in this basin.
- The total number of springs, regardless of discharge, identified by the USGS varies from 169 to 175, depending on the database reference.

Table 5.3-5 Springs in the Tonto Creek Basin

A. Major Springs (10 gpm or greater):

| Мар | | Loc | cation | Discharge | Date Discharge |
|-----|------------------------|----------|-----------|-----------------------|-------------------------|
| Key | Name | Latitude | Longitude | (in gpm) ¹ | Measured |
| 1 | Tonto | 342312 | 1110541 | 1,291 | During or prior to 2001 |

5.3.6 Groundwater Conditions of the Tonto Creek Basin

Major aquifers, well yields, estimated natural recharge, estimated water in storage, number of index wells and date of last water-level sweep are shown in Table 5.3-6. Figure 5.3-6 shows aquifer flow direction and water-level change between 1990-1991 and 2003-2004. Figure 5.3-7 contains hydrographs for selected wells shown on Figure 5.3-6. Figure 5.3-8 shows well yields in five yield categories. A description of aquifer data sources and methods is found in Volume 1, Section 1.3.2. A description of well data sources and methods, including water-level changes and well yields, is found in Volume 1, Section 1.3.19.

Major Aquifers

- Refer to Table 5.3-6 and Figure 5.3-6.
- The major aquifers in the basin are basin fill and sedimentary rock (C and R aquifers).
- Most of the basin geology consists of consolidated crystalline and sedimentary rocks.
- Flow direction is generally from the north to the south.

Well Yields

- Refer to Table 5.3-6 and Figure 5.3-8.
- As shown on Figure 5.3-8, well yields in this basin range from less than 100 gallons per minute (gpm) to greater than 2,000 gpm.
- One source of well yield information, based on 51 reported wells, indicates that the median well yield in this basin is 120 gpm.
- The highest well yields in the basin are located along Highway 188 north of Punkin Center.

Natural Recharge

- Refer to Table 5.3-6.
- There are two estimates of natural recharge for this basin ranging from 17,000 acre-feet per year to 37,000 acre-feet per year.

Water in Storage

- Refer to Table 5.3-6.
- There are three estimates of water in storage for this basin ranging from two million acrefeet to 9.4 million acre-feet. The most recent estimate, from a 1994 ADWR study, is three million acre-feet in storage to a depth of 1,200 feet.
- The predevelopment storage estimate is two million acre-feet to a depth of 1,200 feet.

Water Level

- Refer to Figure 5.3-6. Water levels are shown for wells measured in 2003-2004.
- The Department annually measures 11 index wells in this basin.
- In 1975, the year of the last water level sweep, 42 wells were measured.
- There is one ADWR automated water-level recording device in this basin located near Star Valley.
- The deepest recorded water level in the basin is 106 feet east of Kohls Ranch and the

shallowest is 14 feet near Punkin Center.

• Hydrographs corresponding to selected wells shown on Figure 5.3-6 but covering a longer time period are shown in Figure 5.3-7.

Table 5.3-6 Groundwater Data for the Tonto Creek Basin

| Basin Area, in square miles: | 955 | |

5.3.7 Water Quality of the Tonto Creek Basin

Wells, springs and mine sites with parameter concentrations that have equaled or exceeded drinking water standard(s), including location and parameter(s) are shown in Table 5.3-7A. Impaired lakes and streams with site type, name, length of impaired reach, area of impaired lake, designated use standard and parameter(s) exceeded is shown in Table 5.3-7B. Figure 5.3-9 shows the location of water quality occurrences keyed to Table 5.3-7. A description of water quality data sources and methods is found in Volume 1, Section 1.3.18. Not all parameters were measured at all sites; selective sampling for particular constituents is common.

Wells, Springs and Mines

- Refer to Table 5.3-7A.
- Nine sites have parameter concentrations that have equaled or exceeded drinking water standards
- Standards equalled or exceeded in this basin include arsenic, nitrate/nitrite, beryllium, radionuclides and organic compounds or pesticides.

Lakes and Streams

- Refer to Table 5.3-7B.
- Water quality standards were exceeded in three stream reaches on two streams.
- The standard exceeded in all reaches was E. coli. The two reaches on Tonto Creek also exceeded the standard for nitrates/nitrites.
- All three impaired reaches are part of the ADEQ water quality improvement effort called the Total Maximum Daily Load (TMDL) program. The final TMDL reports for the streams have been completed.

Table 5.3-7 Water Quality Exceedences in the Tonto Creek Basin¹

A. Wells, Springs and Mines

| | | | Site Location | | Parameter(s) Concentration has |
|---------|-----------|----------|---------------|---------|---|
| Map Key | Site Type | Township | Range | Section | Equaled or Exceeded Drinking Water Standard (DWS) ² |

| С | Stream | Tonto Creek (unnamed tributary latitude 341810, longitude 1110414 to Haigler Creek) | 9 | NA | A&W, FBC | E. coli, NO3 |

¹ Water quality samples taken from 1979 to 2002

Be = Beryllium

NO3 = Nitrate/Nitrite

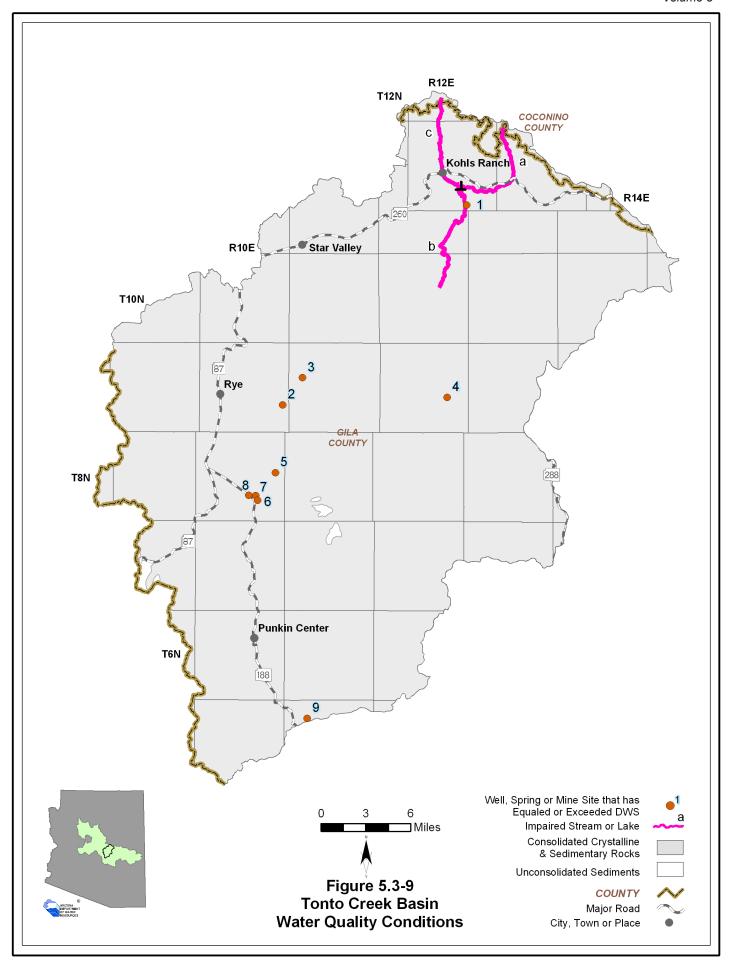

Organics = One or more of several volatile and semi-volatile organic compounds and pesticides Rad = One or more of the following radionuclides - Gross Alpha, Gross Beta, Radium, and Uranium

FBC = Full Body Contact

NA = Not Available

²As = Arsenic

³ A&W = Aquatic and Wildlife

5.3.8 Cultural Water Demands in the Tonto Creek Basin

Cultural water demand data including population, number of wells and the average well pumpage and surface water diversions by the municipal, industrial and agricultural sectors are shown in Table 5.3-8. Effluent generation including facility ownership, location, population served and not served, volume treated, disposal method and treatment level is shown in Table 5.3-9. Figure 5.3-10 shows the location of demand centers. A description of cultural water demand data sources and methods is found in Volume 1, Section 1.3.5. More detailed information on cultural water demands is found in Section 5.0.7.

Cultural Water Demands

- Refer to Table 5.3-8 and Figure 5.3-10.
- Population in this basin has increased from 1,934 in 1980 to 7,537 in 2000. Projections suggest the population will double by 2050 to 16,377.
- Groundwater use has fluctuated from a low of 2,000 acre-feet per year in the 1970s to an average of 4,000 acre-feet per year from 1986-1990. During 2001-2003 the average annual groundwater demand was 3,400 acre-feet per year.
- Municipal groundwater use has increased from an average of 1,600 acre-feet per year in 1991-1995 to 2,200 acre-feet per year in 2001-2003.
- There was no reported industrial groundwater use in 1991. In 2001-2003, industrial demand was 200 acre-feet per year on average.
- Groundwater demand for irrigation was less than 1,000 acre-feet per year on average from 1991-2003.
- Information on surface water diversions is not available from 1971-1990. From 1991-2003, 1,000 acre-feet per year on average was used for irrigation.
- Municipal and industrial demand is principally found in the vicinity of Payson and Star Valley with smaller demand centers scattered along State Highways 188 and 260 as well as east of Rye.
- A small amount of agriculture is located east of Rye and in T9N, R10E.
- There is one small mine or quarry in this basin along Highway 87 south of Payson.
- As of 2003 there were 1,916 registered wells with a pumping capacity of less than or equal to 35 gallons per minute and 93 wells with a pumping capacity of more than 35 gallons per minute.

Effluent Generation

- Refer to Table 5.3-9.
- There is one wastewater treatment facility in this basin. It is a private facility serving the Hunter Creek development near Kohl's Ranch.

ADDITIONAL WELLS: 3

WELL TOTALS: 1,916 93

Notes:

NR - Not reported

¹ Does not include evaporation losses from stockponds and reservoirs.

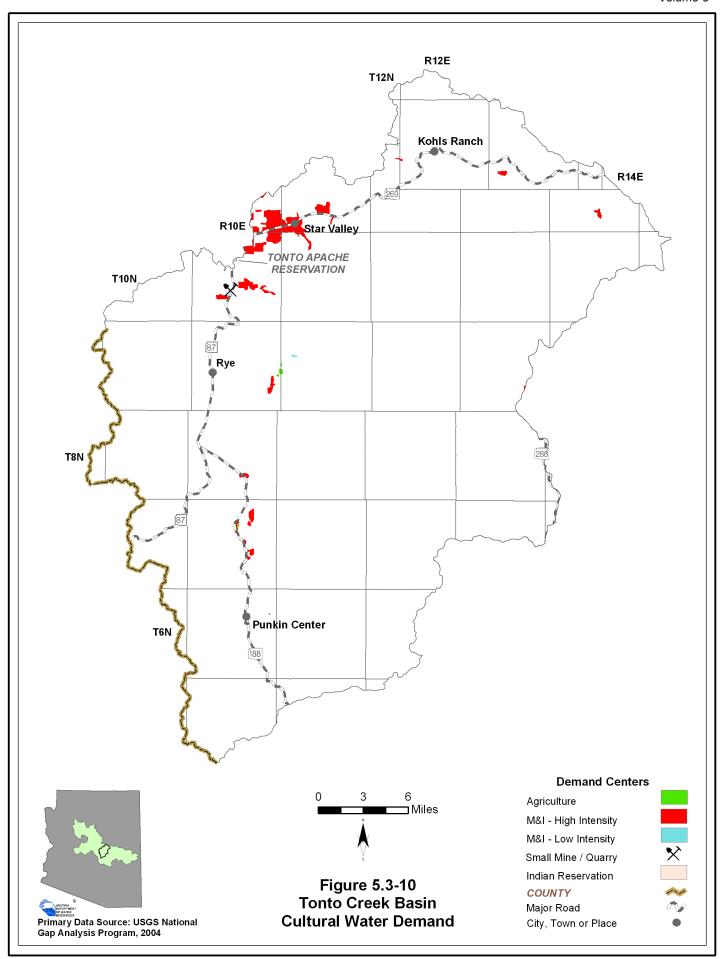

² Includes all wells through 1980.

³ Other water-supply wells are listed in the ADWR Well Registry for this basin, but they do not have completion dates. These wells are summed here

5.3.9 Water Adequacy Determinations in the Tonto Creek Basin

Water adequacy determination information including the subdivision name, location, number of lots, adequacy determination, reason for the inadequacy determination, date of determination and subdivision water provider are shown in Table 5.3-10. Figure 5.3-11 shows the locations of subdivisions keyed to the Table. A description of the Water Adequacy Program is found in Volume 1, Appendix A. Adequacy determination data sources and methods are found in Volume 1, Sections 1.3.1.

Water Adequacy Reports

- A total of 54 water adequacy determinations have been made in this basin through May, 2005.
- The most common reason for an inadequate determination was because the applicant did not submit the necessary information and/or available hydrologic data were insufficient to make a determination.
- Other reasons for an inadequacy determination included: the existing supply was unreliable
 or physically unavailable or groundwater exceeds the depth-to-water criteria; the applicant
 failed to demonstrate a legal right to use the water or failed to demonstrate their legal
 authority to serve the subdivision; and water quality. For one subdivision the reason for the
 inadequacy determination is unknown because the records could not be located.
- All water adequacy determinations are in Gila County. Of the 3,676 lots in 51 subdivisions for which lot information was available, 352 lots or less than 10% were determined to be adequate.

Each determination of the adequacy of water supplies available to a subdivision is based on the information available to ADWR and the standards of review and policies in effect at the time the determination was made.

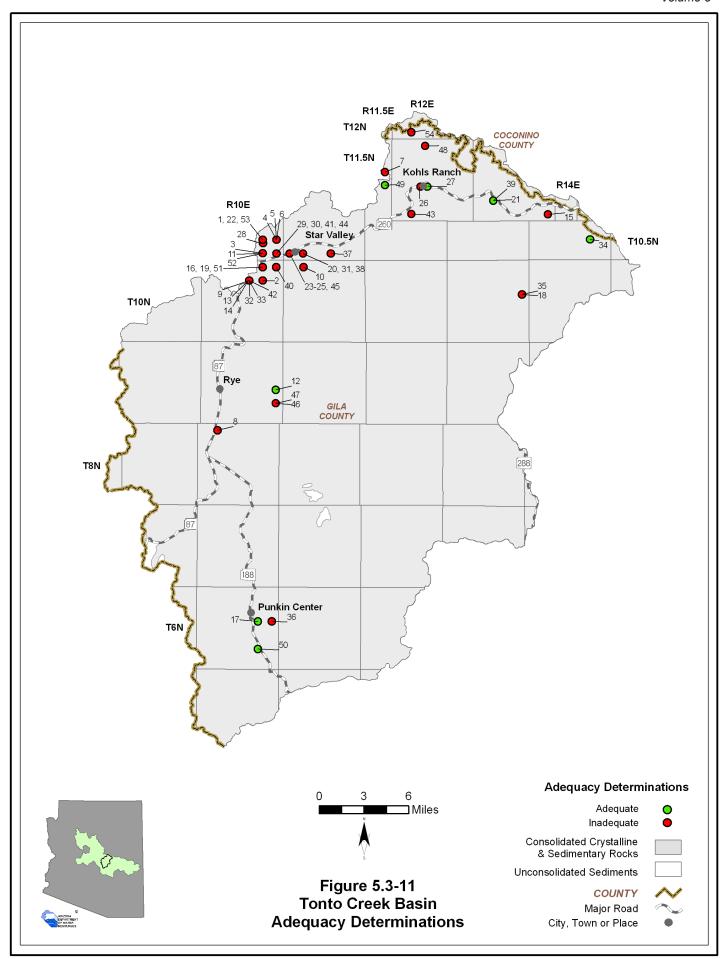

In some cases, ADWR might make a different determination if a similar application were submitted today, based on the hydrologic data and other information currently available, as well as current rules and policies.

Prior to February 1996, ADWR did not assign file numbers to applications for adequacy determination.

Prior to February 1996, ADWR did not assign file numbers to applications for adequacy determination.

Prior to February 1999, ADWR did not assign file numbers to applications for available hydrologic data insufficient to make determination)

Prior file and apply (avsiting water supply unreliable or physically unavaluable) or physically unavaluable or physically un
